

Install & Permissions Guide

A few simple steps, and everything you need to know about permissions

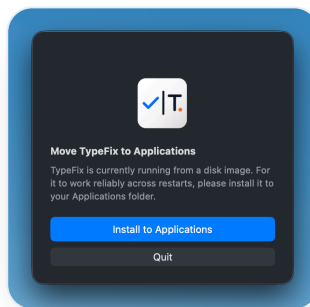

Welcome to **TypeFix**. Typed in the wrong language by mistake? One click and the text is fixed instantly. Installation takes under a minute – let's walk through it together.

1 First launch – Apple's approval

The first time you open TypeFix, macOS shows a quick confirmation that it was downloaded from the internet – and notes that **Apple checked it for malicious software and none was detected**. Just click **Open** – that's it, and you won't be asked again.

2 Install

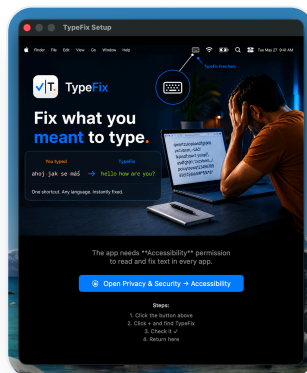

Once it opens, drag **TypeFix** into your **Applications** folder. If you opened it straight from the DMG, it will offer to install itself – click **Install to Applications**.

TypeFix offers to install itself to Applications.

3 Accessibility permission – why it's needed

TypeFix needs one **Accessibility** permission, so it can **read** the text you typed and **replace** it with the corrected version. Without it, the app simply can't see or fix your text. The app guides you – click **Open Privacy & Security** → **Accessibility**.

The welcome screen explains it and links straight to Settings.

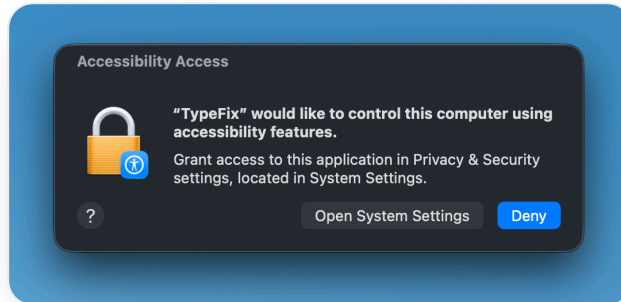

Your privacy – your text stays with you

TypeFix does not collect, store, or send anything you type. The permission is used **only locally, on your Mac**, and only the moment you trigger the shortcut – never at any other time.

4 Allow access

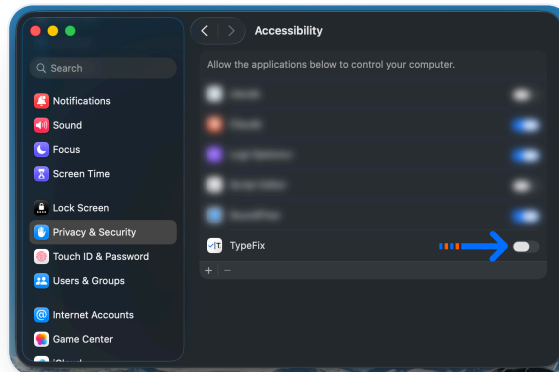

A system dialog will ask to allow TypeFix to control your computer using accessibility features. Click **Open System Settings**.

The macOS permission dialog.

5 Turn on the switch

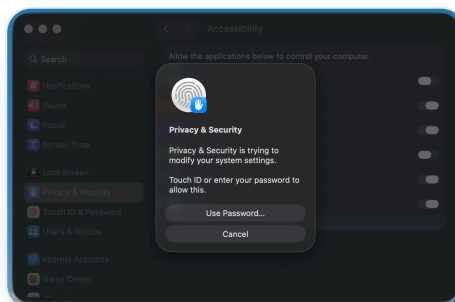

In **Privacy & Security** → **Accessibility**, find **TypeFix** in the list and turn on its switch.

Flip the switch next to TypeFix.

6 Authenticate

macOS will ask you to confirm with **Touch ID** or your password to apply the change. Confirm – and that's it.

Quick authentication with Touch ID or password.

✓ Done! Here's how to use it

Typed in the wrong language? Select the text (or just leave the cursor in the field) and press the shortcut — TypeFix detects and fixes it instantly.

⌘ ⇧ K Fix typing language

Frequently asked questions

Is it safe? Yes. TypeFix runs only on your Mac, without sending anything anywhere. The warning at first launch is Apple's standard procedure for any app outside the App Store.

Why does it need Accessibility? It's the only way in macOS to read the text you typed in another app and replace it with the fix. Without it, the app can't work.

Does it read everything I type? No. TypeFix reads the text **only the moment you press the shortcut**, and locally only. It does not log keystrokes or store anything.

How do I uninstall it? Open **Uninstall TypeFix** in the DMG — it cleanly removes the app, its preferences, and its permissions.
